TECNOLOGIE FRB progetta, costruisce e commercializza diverse linee di prodotti brevettati, veramente innovativi e di concezione tecnologica avanzata nel settore delle lavorazioni meccaniche di tornitura, dentatura e rettifica.

Costantemente impegnata nella ricerca tecnologica e nel miglioramento delle prestazioni dei propri prodotti, dalla sua fondazione nei primi anni 60, ha riscosso la fiducia di numerose aziende di primaria importanza nazionale e internazionale, che utilizzano abitualmente i suoi prodotti. Inoltre collabora attivamente con gli uffici tecnici dei più importanti costruttori di macchine utensili italiani ed esteri.

Gli appuntamenti con le novità tecnologiche (sempre più frequenti) dei prossimi anni, troveranno **TECNOLOGIE FRB** compartecipe attiva e all'avanguardia.

***TECNOLOGIE FRB** designs, manufactures and markets many different patented product lines that are truly innovative and incorporate advanced technology turning, gear cutting and grinding concepts.*

***TECNOLOGIE FRB** have invested heavily in Research & Development right from the day they started in early sixties, to ensure their products keep abreast of the latest technological advance and constantly improve their performance.*

This has won them the trust of many leading italian and international companies, who always use their products. They also work closely with the design offices of leading italian and foreign machine tools manufacturers.

***TECNOLOGIE FRB** are going to continue to be at the forefront despite the ever increasing pace of technological change.*

TRASCINATORE AD AZIONAMENTO A MOLLE FACE DRIVER OPERATED BY SPRINGS

L'intera superficie esterna del pezzo può essere lavorata e finita in un'unica fase.

I trascinatori FRB ad azionamento molleggiato sono adatti alle lavorazioni di tornitura del tenero e dentatura.

Il bloccaggio del pezzo avviene mediante la spinta che la contropunta esercita sul pezzo, la quale permette l'arretramento della punta centrale fino a che gli artigli non entrano in contatto con la faccia del pezzo.

I trascinatori molleggiati FRB garantiscono:

- Riferimenti degli scostamenti su facce e diametri;
- Scostamenti massimi di 0,05 mm.

The entire outer surface of the workpiece can be machined and finished in one step.

The FRB face driver operated by springs are suitable for soft turning and hobbing operations.

The clamping of the workpiece takes place by means of the thrust of the tailstock exercises on the workpiece, which allows the backward movement of the center point until the driving pins make contact with the face of the workpiece.

The FRB face driver operated by springs guarantee:

- Reference of the run-out deviations on faces and diameter;
- Maximum run-out deviation of 0,05 mm.

**SPINTA ASSIALE DELLA CONTROPUNTA
AXIAL THRUST OF THE TAILSTOCK**

TRASCINATORE AD AZIONAMENTO IDRAULICO FACE DRIVER OPERATED BY HYDRAULIC CYLINDER

L'intera superficie esterna del pezzo può essere lavorata e finita in un'unica fase.

I trascinatori FRB a punta fissa ed azionamento idraulico sono adatti alle lavorazioni di tornitura del tenero, tornitura del temprato e rettifica. Il bloccaggio del pezzo avviene mediante una spinta assiale sul lato contropunta ed una spinta assiale di un cilindro, posto sul lato della testa della macchina, che spinge gli artigli a contatto con il pezzo.

I trascinatori a punta fissa FRB garantiscono:

- Riferimenti degli scostamenti sui centri o sull'asse del pezzo
- Scostamenti massimi di 0,02 mm (in tornitura) e 0,0025 mm (in rettifica).

The entire outer surface of the workpiece can be machined and finished in one step.

The FRB face driver with fixed center point and driving pins operated by hydraulic cylinder are suitable for soft turning, hard turning and grinding. The workpiece is locked by an axial thrust on the tailstock side and an axial thrust of a cylinder, placed on the head side of the machine, which pushes the driving pins in contact with the workpiece.

The FRB face driver with fixed center point guarantee:

- Reference of the run-out deviations on the centers or on the axis of the workpiece
- Maximum run-out deviation of 0,02 mm (for turning) and 0,0025 mm (for grinding).

RAPPORTO DI SERRAGGIO (RS) CLAMPING RATIO

Il rapporto di serraggio "RS" è la relazione definita tra il diametro massimo di lavoro da eseguire e il diametro massimo di presa consentito dagli artigli del trascinatore FRB.

ØA => Diametro di presa degli artigli

ØB => Diametro massimo di lavoro del pezzo

$$RS = \frac{\text{ØB}}{\text{ØA}}$$

Esempio:

ØA = Ø28 mm (1.102 inch)

ØB = Ø28 mm (1.102 inch) => RS=1

Ø42 mm (1.654 inch) => RS=1,5

Ø56 mm (2.205 inch) => RS=2

Ø70 mm (2.756 inch) => RS=2,5

La scelta appropriata per il trascinatore deve ricadere, preferibilmente e compatibilmente alle caratteristiche del pezzo da lavorare, nel campo di rapporto di serraggio non superiore a **2 per la tornitura** e **3 per la rettifica**. Valori di serraggio superiori vanno valutati molto attentamente con l'ausilio ed il supporto di Tecnologie FRB.

The clamping ratio "RS" is the relationship defined between the maximum working diameter to be machined and the maximum clamping diameter allowed by the driving pins of the FRB face driver.

ØA => Clamping diameter of the driving pins

ØB => Maximum working diameter of the workpiece

$$RS = \frac{\text{ØB}}{\text{ØA}}$$

Example:

ØA = Ø28 mm (1.102 inch)

ØB = Ø28 mm (1.102 inch) => RS=1

Ø42 mm (1.654 inch) => RS=1,5

Ø56 mm (2.205 inch) => RS=2

Ø70 mm (2.756 inch) => RS=2,5

The appropriate choice for the face driver must fall, preferably and compatibly with the characteristics of the workpiece, in the clamping ratio range of no more than **2 for turning** and **3 for grinding**. Higher clamping ratio values must be evaluated very carefully with the help and support of Tecnologie FRB.

SPINTA ASSIALE DA APPLICARE AL SISTEMA TRASCINATORE FRONTALE E CONTROPUNTA AXIAL THRUST TO BE APPLIED TO THE FACE DRIVER AND TAILSTOCK SYSTEM

La spinta assiale consigliata o disponibile è da applicare alla macchina utensile con due metodologie differenti:

- Per trascinatori frontali FRB a punta molleggiata la spinta assiale è interamente applicata alla contropunta;
- Per trascinatori frontali FRB a punta fissa la spinta assiale è da applicare anche al sistema di azionamento degli artigli; la contropunta invece dovrà assumere valori di spinta assiale maggiorati di circa 15-20% rispetto alla spinta applicata sugli artigli del trascinatore.

Si raccomanda sia nel primo caso che nel secondo di effettuare la prima passata di lavoro sempre a favore del trascinatore, cioè da contropunta verso trascinatore, per garantire una perfetta penetrazione degli artigli in presa.

Nel primo caso (per trascinatori a punta molleggiata), comunque, quando si lavorerà da trascinatore verso contropunta, è necessario ridurre i parametri di lavoro di circa un 20% (avanzamento e/o profondità di passata).

The recommended or available axial thrust is to be applied to the machine tool with two different methods:

- *For FRB face drivers with center point operated by springs the axial thrust is entirely applied to the tailstock;*
- *For FRB face drivers with fixed center point the axial thrust must also be applied to the driving pins actuation system; the tailstock instead must assume axial thrust values increased by about 15 ÷ 20% respect to the thrust applied on the driving pins of the face driver.*

It is recommended both in the first case and in the second to make the first working cut always in favor of the face driver, that is from tailstock towards the face driver, to ensure perfect penetration of the driving pins in the workpiece.

In the first case (for spring loaded face drivers), anyway, when you work from the face driver to the tailstock, it is necessary to reduce the working parameters approximately a 20% (feed and / or depth of cut).

Spinta assiale: 8000 N (esempio)
Axial thrust: 8000 N (example)

Spinta assiale: 6400 N (esempio)
Axial thrust: 6400 N (example)

Spinta assiale: 8000 N (esempio)
Axial thrust: 8000 N (example)

ISTRUZIONI PER IL CENTRAGGIO DEL TRASCINATORE SU FLANGIA CON GRANI DI CENTRAGGIO INSTRUCTIONS FOR CENTERING THE FACE DRIVER ON THE FLANGE WITH GRUB SCREW CENTERING

1. Dopo aver montato la flangia nella macchina, montare il trascinatore nella flangia serrando leggermente le viti (pos. 2);
2. Posizionare il comparatore sulla punta centrale (pos. 3) per eseguire il centraggio;
3. Eseguire il centraggio per mezzo dei grani radiali (pos.1) posti nella flangia;
4. Dopo aver eseguito il centraggio del trascinatore, serrare definitivamente le viti (pos. 2);
5. I grani radiali (pos. 1) vanno tenuti serrati sul trascinatore.

1. After mounting the flange on the machine, fit the face driver into the flange and tighten the screws lightly (pos.2);
2. Position the gauge on the center point (pos. 3) to make the centering;
3. Make the centering by means of the radial grub screws (pos. 1) placed in the flange;
4. After centering of the face driver, fully tighten the screws (pos. 2);
5. The radial grub screws (pos. 1) must be kept tightened on the face driver.

ISTRUZIONI PER IL CENTRAGGIO DELLA TESTINA CON GRANI DI CENTRAGGIO INSTRUCTIONS FOR CENTERING THE FACE PLATE WITH GRUB SCREW CENTERING

1. Allentare leggermente le viti di fissaggio della testina (pos.1)
2. Posizionare il comparatore sulla punta centrale (pos. 2) per eseguire il centraggio;
3. Eseguire il centraggio per mezzo dei grani radiali (pos. 3) posti nella testina;
4. Dopo aver eseguito il centraggio della testina, serrare definitivamente le viti (pos. 1);
5. I grani radiali (pos. 3) vanno tenuti serrati sul trascinatore.

1. *Unloose lightly the screws (pos. 1)*
2. *Position the gauge on the center point (pos. 2) to make the centering;*
3. *Make the centering by means of the radial grub screws (pos. 3) placed in the face plate;*
4. *After centering of the face plate, fully tighten the screws (pos. 1);*
5. *The radial grub screws (pos. 3) must be kept tightened on the face driver*

MODALITÀ DI BLOCCAGGIO DEI TRASCINATORI A FLANGIA INTEGRALE SU AUTOCENTRANTE LOCKING METHOD OF THE FACE DRIVERS WITH INTEGRAL FLANGE ON SELF-CENTERING CHUCK

Per effettuare il bloccaggio in maniera corretta del trascinatore frontale su autocentrante è necessario fare la tornitura dei morsetti teneri in modo da recuperare il gioco assiale e radiale dell'autocentrante.

- Serrare tra i tre morsetti una flangia tonda del diametro opportuno e ricavare il diametro $\varnothing D$;
- Poi dopo aver serrato l'apposito anello nel diametro $\varnothing D$, ricavare il diametro $\varnothing C$.

To correctly lock the face driver on the chuck, it is necessary to turn the soft jaws to take up the axial and radial slack of the chuck.

- Tighten a round flange of the appropriate diameter between the three jaws and obtain the diameter $\varnothing D$;
- Then after having tightened the special ring in the diameter $\varnothing D$, obtain the diameter $\varnothing C$.

Trascinatore Face driver	A	B	$\varnothing C$	$\varnothing D$	$\varnothing E$
- 6/30 - 12/50 - - 15/55 - 20/60 -	16 (0.630)	56 (2.205)	109 (4.291)	160 (6.299)	32 (1.260)
20/70	16 (0.630)	62 (2.441)	109 (4.291)	160 (6.299)	32 (1.260)
45/120	22 (0.866)	108 (4.252)	153 (6.024)	200 (7.874)	32 (1.260)

SOSTITUZIONE DEGLI ARTIGLI REPLACEMENT OF THE DRIVING PINS

Per sostituire gli artigli di un trascinatore frontale non sono necessari attrezzi o chiavi.

- Prendere con le mani l'artiglio e farlo scorrere assialmente fino ad estrarlo dalla sua sede. In caso di necessità, aiutarsi con uno straccio o con una pinza per una maggiore presa.

Per introdurre nuovamente gli artigli:

- Introdurre gli artigli manualmente facendoli scorrere in direzione dell'asse del trascinatore e mantenendo il piano fresato rivolto verso l'esterno. L'operazione può essere effettuata con il trascinatore già montato in macchina, senza pregiudicare la precisione dello stesso. Durante questa operazione è consigliato mettere un velo di grasso.

I grani radiali presenti nella testina hanno la funzione di antirotazione dell'artiglio; allo stesso modo però devono permettere all'artiglio una rotazione attorno al proprio asse di circa 0,2÷0,3 mm al fine di potersi assestare in seguito alla presenza di eventuali imperfezioni o bave presenti sulla faccia del pezzo da trascinare.

I 4 grani radiali, essendo stati registrati in fase di montaggio, non devono più essere più toccati.

No tools or wrenches are required to replace the driving pins of the face driver.

- *Take the driving pin with your hands and slide it axially until it comes out of its seat. If necessary, help yourself with a rag or pliers for a better grip.*

To re-introduce the driving pins:

- *Introduce the driving pins manually by sliding them in the direction of the axis of the face driver and keeping the milled plane turned outwards. The operation can be carried out with the face driver already mounted on the machine, without compromising its accuracy. During this operation it is recommended to put a layer of grease.*

The radial screws present in the washer have the function of anti-rotation of the driving pin; in the same way, however, they must allow the driving pin to rotate around its axis of about 0,2÷0,3 mm in order to be able to settle down following the presence of any imperfections or burrs on the face of the piece to be dragged. The 4 radial screws, having been registered during the assembly phase and don't have to be touched

SOSTITUZIONE DELLA PUNTA CENTRALE NEI TRASCINATORI A PUNTA MOLLEGGIATA REPLACING THE CENTER POINT IN A SPRING-LOADED FACE DRIVER

Per sostituire la punta centrale di un trascinatore frontale a punta molleggiata, non sono necessari attrezzi o chiavi.

- Prendere con le mani la punta centrale e farla scorrere assialmente fino ad estrarla dalla sua sede. In caso di necessità, aiutarsi con uno straccio o un paio di pinze per una maggiore presa.

Per introdurre nuovamente la punta centrale:

- Farla scorrere in direzione dell'asse del trascinatore, fino a farla arrivare nel suo appoggio. L'operazione può essere effettuata con il trascinatore già montato in macchina, senza pregiudicare la precisione dello stesso.

No tools or wrenches are required to replace the center point of a spring-loaded face driver.

- *Take the center point with your hands and slide it axially until it comes out of its seat. If necessary, help yourself with a rag or a pliers for a better grip.*

To re-introduce the center point:

- *Slide it in the direction of the face driver axis, until it reaches its support. The operation can be carried out with the face driver already mounted on the machine, without compromising the accuracy of the same.*

SOSTITUZIONE DELLA PUNTA CENTRALE NEI TRASCINATORI A PUNTA FISSA REPLACING THE CENTER POINT IN A FACE DRIVER WITH FIXED CENTER POINT

Nei trascinatori frontali a punta fissa, ci sono uno o due grani (a seconda del modello) che tengono bloccata la punta centrale nella sua sede. Prima di procedere alla sostituzione, allentare i grani che la bloccano, ed una volta sostituita la punta centrale stringere nuovamente i grani di bloccaggio, facendo attenzione ad impegnarli nuovamente lungo le fresature della punta centrale.

In the face drivers with fixed center point, there are one or two grains (depending on the model) which keep the center point locked in its seat. Before proceeding with the replacement, loosen the grains that block it, and once the center point has been replaced, tighten the locking grain again, making sure to re-engage them along the grooves of the center point.

MODALITÀ D'IMPIEGO DELLA PUNTA A CAPRUGGINE NEI TRASCINATORI MOLLEGGIATI METHOD OF USE OF THE CENTER WITH SLOTS IN SPRING LOADED FACE DRIVER

Con il trascinatore frontale si possono lavorare anche particolari che invece del centro, hanno dei fori più o meno grandi, dipendenti dalle caratteristiche del pezzo. È sufficiente montare la punta centrale a capruggine della dimensione adeguata.

Quando si usano le punte a capruggine, bisogna controllare sempre la lunghezza degli artigli di trascinamento, la quale non deve mai essere inferiore di 3 mm rispetto alla misura originale indicata nel catalogo. Questo vale a dire che gli artigli di trascinamento si possono affilare accorciandoli fino ad un massimo di 3 mm (E) rispetto alla loro lunghezza originale. Per un corretto funzionamento della punta a capruggine, è necessario che questa, quando è sotto carico, non sia mai in battuta contro il piano (K) della testina porta artigli. La dimensione della capruggine è da scegliere in funzione della misura "Ø F".

With the face driver you can also machining workpieces that instead of the center, have more or less large holes, depending on the characteristics of the workpiece. It is sufficient to mount the center point with slots of the right size.

When using the center points with slots, always check the length of the driving pins, which must never be less than 3 mm than the original size indicated in the catalogue.

This means that the driving pins can be sharpened by shortening them up to a maximum of 3 mm (E) compared to their original length.

For a correct functioning of the center point with slots, it is necessary that this, when under load, never touches the plane (K) of the face plate.

The size of the center point with slots has to be chosen according to the measure "Ø F".

DEFINIZIONE DEL SENSO DI ROTAZIONE DEL TRASCINATORE FRONTALE DEFINITION OF THE DIRECTION OF ROTATION OF THE FACE DRIVER

Sul trascinatore frontale possono essere montati artigli con rotazione di lavorazione antioraria ed artigli con rotazione oraria. Per definire il senso di rotazione guardarlo frontalmente. Il lato delle lame con l'inclinazione maggiore è quello di traino, quindi quello in cui deve tirare.

Esempio: lato inclinato destro, rotazione oraria; lato inclinato sinistro, rotazione antioraria. Una volta montato in macchina il trascinatore, verificare che la rotazione del mandrino corrisponda con quella degli artigli montati sul trascinatore.

Driving pins with counterclockwise rotation and driving pins with clockwise rotation can be mounted on the face driver. To define the direction of rotation, look at it from the front. The side of the blades with the greatest inclination is the towing one, therefore the one in which it must pull.

Example: right inclined side, clockwise rotation; left inclined side, counterclockwise rotation. Once the driver has been mounted on the machine, check that the rotation of the spindle corresponds to that of the driving pins mounted on the face driver.

TRASCINATORI PER RETTIFICA FACE DRIVER FOR GRINDING

Con questa gamma di trascinatori, per trainare alberi temprati fino ad HRC 63 e alberi non temprati, siamo convinti di soddisfare qualsiasi esigenza tecnica proposta.

Il trascinatore ha all'interno un sistema autocompensazione degli artigli molto sensibile che gli permette di avere un'altissima capacità di traino e un'estrema precisione di concentricità ottenibile sul pezzo da rettificare.

Per esempio, per rettificare un albero da diametro 5 mm a diametro 7 mm ipotizzando un contatto di fascia mola di 40 mm, sono sufficienti 70 kg di spinta assiale dal lato della contropunta rotante (anche questa da noi fornita per poter ottenere una rotondità dell'albero entro 0,0015 mm).

With this range of face drivers, for driving hardened shafts of up to HRC 63 and non-hardened shafts too, we are convinced to satisfy any proposed technical requirement.

The face driver has integrated a highly sensitive self-compensation system of the driving pins that allows it to have a very high driving capacity and an extreme precision of concentricity obtainable on the workpieces to be ground.

For example, for grind a shaft from diameter 5 mm to diameter 7 mm, assuming a contact wheel of 40 mm, 70 kg of axial thrust on the side of the live center are sufficient (also supplied by us in order to obtain a shaft roundness within 0,0015 mm).

ISTRUZIONI PER IL CENTRAGGIO DELLA TESTINA PORTA ARTIGLI MEDIANTE L'ALBERO DI CENTRAGGIO INSTRUCTIONS FOR CENTERING THE DRIVING PIN WASHER BY MEANS OF THE CENTERING SHAFT

L'albero di centraggio serve per centrare la punta centrale del trascinatore entro i 0,002 mm.

Inserire l'albero di centraggio fra trascinatore e contropunta nelle stesse identiche condizioni di carico assiale del pezzo da lavorare.

Allentare quindi leggermente con una chiave a brugola le viti pos.1 (vedi figura).

Posizionare il comparatore millesimale sull'albero dal lato trascinatore e utilizzando i grani pos. 2, centrare l'albero.

Ottenuta la centratura desiderata, lasciando in appoggio i grani, riserrare le viti pos. 1.

The centering shaft is used to center the face driver's centre point within 0,002 mm.

Putting the centering shaft between face driver and live center in the same axial load conditions as those of piece to be machined. Then use an allen wrench to slightly unloose the screws pos. 1 (see picture).

Position the micrometer-comparator on the face driver side of the centering shaft and center the shaft by means of the dowels pos.2. Once obtained centering required, leaving the dowels resting and tighten the screw pos. 1.

ISTRUZIONI PER LA SCELTA DEI PARAMETRI DI CARICO ASSIALE SU CONTROPUNTE E TRASCINATORI INSTRUCTIONS FOR SELECTING AXIAL LOAD PARAMETERS ON LIVE CENTERS AND FACE DRIVERS

PER ALBERI FOR SHAFTS		SPINTA ASSIALE MINIMA MINIMUM AXIAL THRUST (Per contatti mola di circa 40 mm) (For grinding wheel contacts about 40 mm)		SPINTA ASSIALE MASSIMA MAXIMUM AXIAL THRUST (Per contatti mola di circa 80 mm) (For grinding wheel contacts about 80 mm)	
		Sugli artigli On the driving pins	Sulla contropunta On the live center	Sugli artigli On the driving pins	Sulla contropunta On the live center
Dal Ø / From Ø	Ai Ø / To Ø	Kg (Lbs)	Kg (Lbs)	Kg (Lbs)	Kg (Lbs)
5 (0.197)	9 (0.354)	56 (123)	70 (154)	88 (194)	110 (243)
10 (0.394)	15 (0.591)	72 (159)	90 (198)	120 (265)	150 (331)
16 (0.630)	30 (1.181)	80 (176)	100 (220)	160 (353)	200 (441)
31 (1.220)	50 (1.969)	120 (265)	150 (331)	200 (441)	250 (551)
51 (2.008)	100 (3.937)	176 (388)	220 (485)	240 (529)	300 (661)

N.B. I suddetti valori sono comunque indicativi e variabili in considerazione della fascia di contatto mola, del tipo di materiale da lavorare e dalla tipologia di pezzo.
Per avere dei valori esatti ed ulteriori informazioni potete contattarci.

N.B. The above values are indicative and variables considering the tread of the wheel, the type of material to be machined and the type of workpiece.
For exact values and further information you can contact us.

VERIFICA DELLE SPINTE ASSIALI AXIAL THRUST CHECK

Evitare assolutamente, dopo aver bloccato il pezzo tra contropunta e trascinatore, di verificare la tenuta del traino tentando di ruotare il pezzo con le mani; questa operazione infatti causa una sicura perdita del tagliente dell'artiglio in metallo duro.

Never, after locking piece between the tailstock and the face driver, check the driving capacity trying to rotate the piece with the hands; this fact leads to a certain loss of sharp in the carbide driving pin.

Se non possedete una cella di carico (vedi la nostra a pag. 133) o un dinamometro per queste verifiche, potrete ottenere i valori di spinta in Kg, moltiplicando l'area del cilindro pneumatico od idraulico, (ottenuta moltiplicando il raggio in cm x raggio x 3,14) per la pressione del cilindro in bar o atmosfere.

FORMULA:
 r^2 (in cm) x π x P (in BAR o ATM) = Spinta in Kg.

If you don't have a load cell (see our on page 133) or a dynamometer for these checks, you can obtain thrust values in Kg by multiplying the area of the pneumatic or hydraulic cylinder (obtained by multiplying radius in cm x radius x 3,14) by the pressure of the cylinder in bar or atmospheres.

FORMULA:
 r^2 (in cm) x π x P (in BAR o ATM) = Thrust in Kg.

MANUTENZIONE MAINTENANCE

- Per la manipolazione del trascinatore si raccomanda di utilizzare sempre guanti protettivi per proteggersi dalla lama degli artigli e dalla punta centrale.
 - Fare manutenzione al trascinatore frontale non è indispensabile, dato che il sistema è completamente meccanico. Consigliamo ogni circa 400 ore di lavorazione, di procedere all'estrazione degli artigli di trascinamento e della punta centrale e di verificarne la perfetta efficienza. Sugeriamo di ingrassarli, così da creare una sottile pellicola, tale da impedire all'acqua emulsionata di entrare all'interno del corpo trascinatore.
 - Il grano posteriore presente nei trascinatori frontali (versioni con punta centrale molleggiata), ha la funzione di tenere precaricate le molle a tazza presenti all'interno. Questa regolazione viene fatta in fase di montaggio e quindi NON deve mai essere toccato.
- *When handling the face driver, it is recommended to always use protective gloves to protect yourself from the blade of the driving pins and the center point.*
 - *Making maintenance to the face driver is not essential since the system is completely mechanical. We recommend every 400 working hours, to proceed with the extraction of the driving pins and the center point and verify their perfect efficiency. We suggest greasing them, so as to create a thin film, such as to prevent the emulsified water from entering on the face driver body.*
 - *The rear grain present in the face drivers (versions with spring-loaded center point), has the function of keeping the Belleville present inside preloaded. This adjustment is made during assembly and therefore it must NEVER be touched.*

Grano posteriore
Rear grain

**NON TOCCARE!
DON'T TOUCH!**

MANUTENZIONE MAINTENANCE

- Attenzione: se gli artigli montati sul vostro trascinatore non sono dotati di dente antiestrazione non capovolgere il trascinatore per evitare la fuoriuscita degli artigli (vedi esempio figura 2 con trascinatore a punta fissa) ed anche della punta centrale (vedi figura 3 esempio con trascinatore a punta molleggiata).
- È necessario monitorare lo stato di affilatura degli artigli. L'usura degli artigli in un trascinatore frontale è molto difficile da quantificare in ore di lavoro o in pezzi lavorati. I differenti materiali da lavorare, parametri di lavoro, ecc., rendono quasi impossibile dare un'informazione precisa su ogni quanto tempo bisogna affilare gli artigli. Possiamo comunque dire che, per chi cambia spesso tipologia di lavoro, la decisione su quando effettuare l'affilatura degli artigli è da valutare visivamente, guardando la lama (presenza di un po' di piano sul tagliente o qualche scheggiatura) ed il pezzo appena finito di lavorare. Se le 4 incisioni lasciate dal trascinatore non sono dritte, ma leggermente aperte (a ventaglio), è bene procedere ad una affilatura e, in queste condizioni, è sufficiente di pochi decimi di millimetro. Per chi, invece, ha serie di pezzi molto numerose, sarà sufficiente segnarsi le prime volte il numero di pezzi lavorati, prima di arrivare all'usura sopracitata.
- Si possono eseguire affilature su un artiglio di un trascinatore frontale, fino a che non abbiamo accorciato la lama di 3 mm. Oltre non è consigliabile procedere, per non andare a pregiudicare la corsa della punta centrale. Durante l'operazione di affilatura, fare molta attenzione a non scaldare la lama.

- Attention: if the driving pins mounted on your face driver do not have an anti-extraction tooth do not overturn the face driver to prevent the driving pins from coming out (see example figure 2 of face driver with fixed point) and also of the center point (see figure 3 example with spring-loaded face driver)
- It is necessary to monitor the state of sharpness of the driving pins. The wear of the driving pins in a face driver is very difficult to quantify in hours worked or in machined parts. The different materials to be machined, working parameters, etc., make it almost impossible to give precise information on how often the driving pins need to be sharpened. We can however say that, for those who often change type of work, the decision on when to sharpen the driving pins is to be evaluated visually, looking at the blade (presence of a little flat on the cutting edge or some chipping) and the workpiece just finished working. If the 4 incisions left by the face driver are not straight, but slightly open (fan-shaped), it is advisable to sharpen and, in these conditions, a few tenths of a millimeter are sufficient. For those, however, has very numerous series of pieces, it will be sufficient to mark the number of pieces processed the first few times, before reaching the aforementioned wear.
- You can sharpen a driving pin of a face driver, until we have shortened the blade by 3 mm. It is not advisable to proceed further, in order not to affect the stroke of the center point. During the sharpening operation, be very careful not to heat the blade.
